

DATA SOURCE

1.The data given to us for this research.

Which has 54 variables related to electricity, gas emissions and renewable energy by country from 1990 to 2021.

2.Data found on global countries geometry.
The source is:

<https://www.naturalearthdata.com/downloads/>

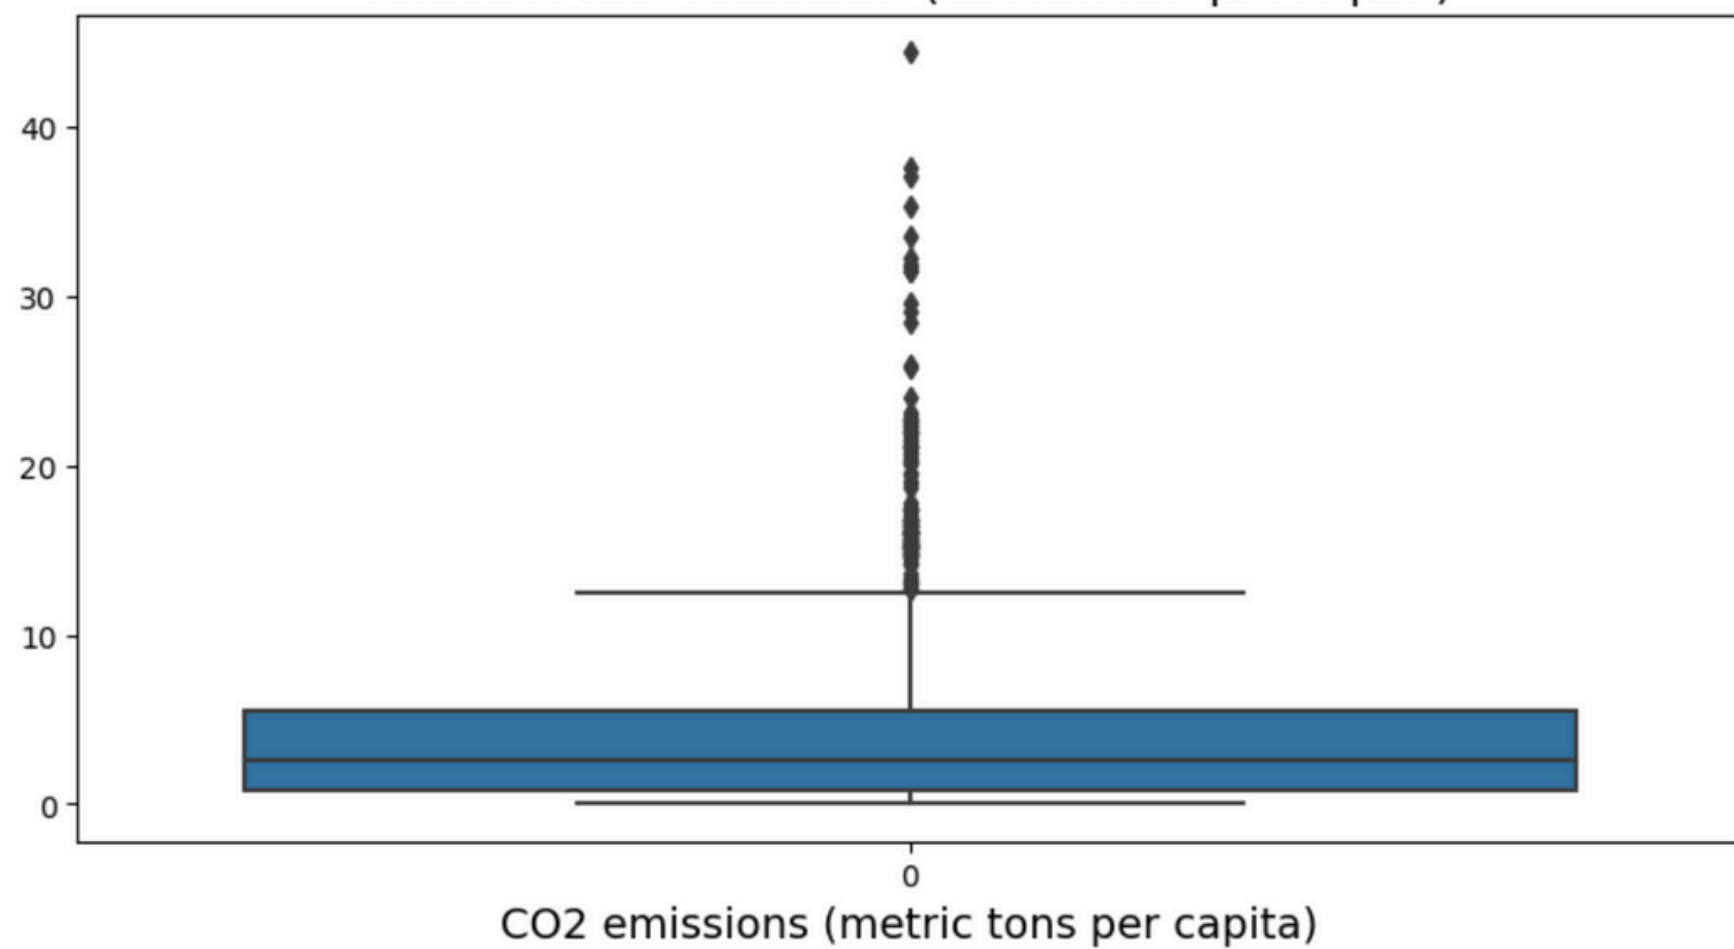

DATA PREPARATION

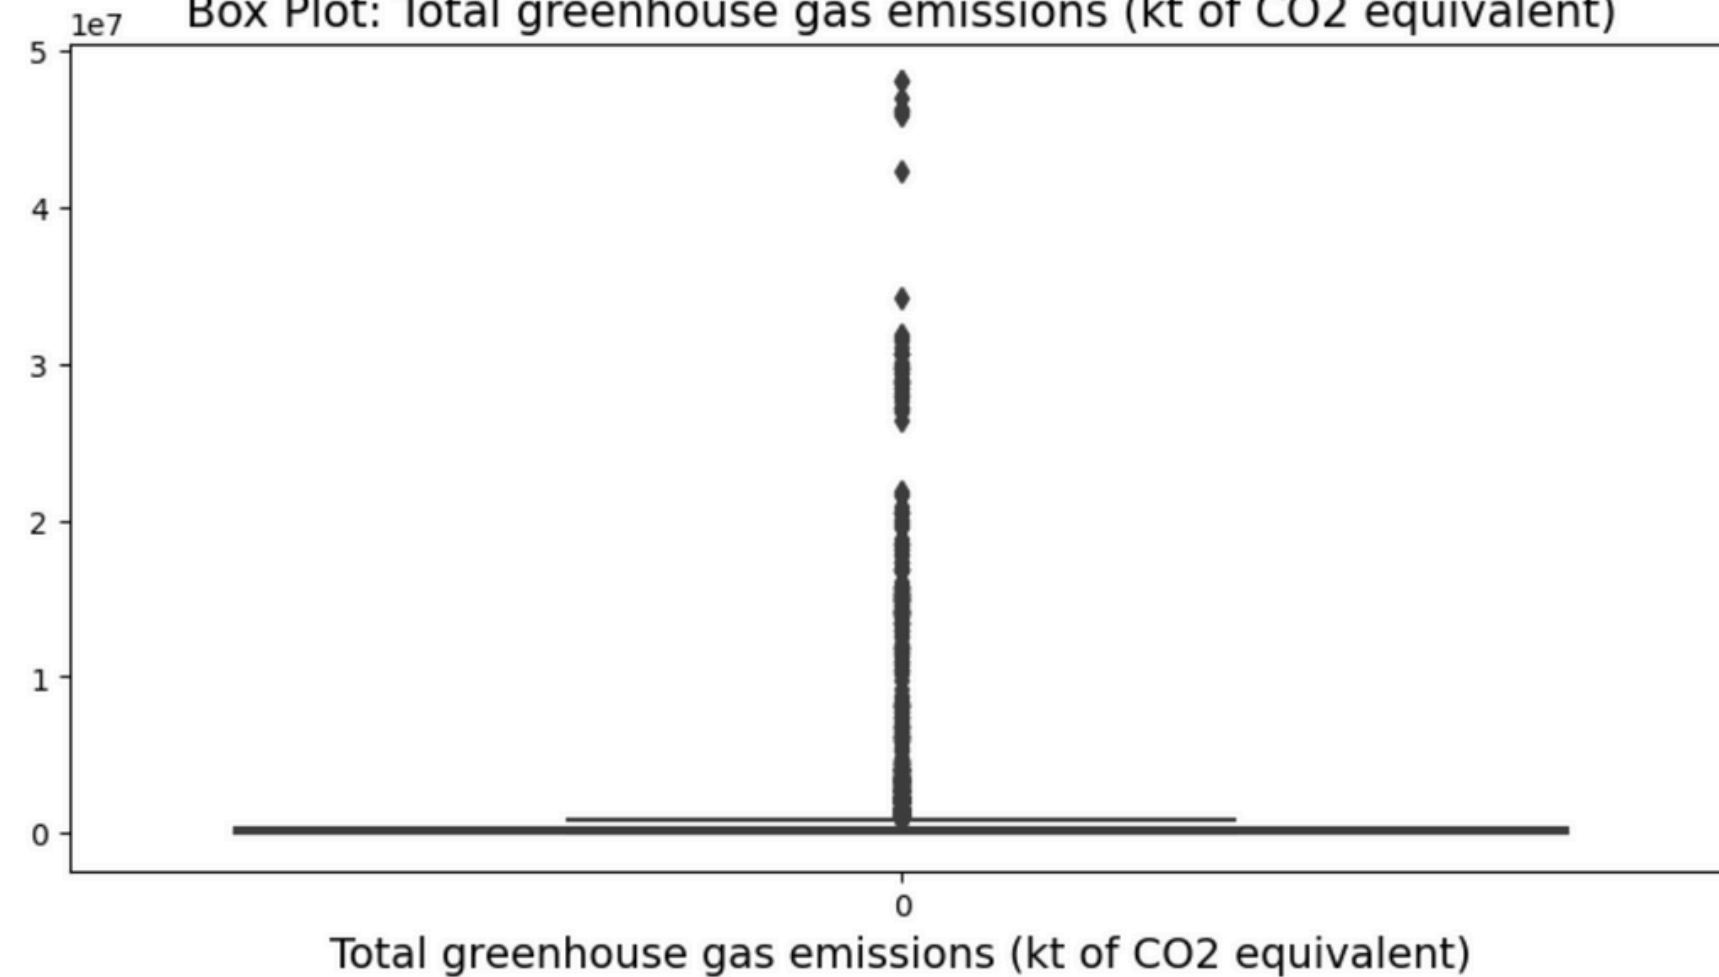

- ▶ Missing values
- ▶ Mislabeled Data
- ▶ Outliers
- ▶ EDA

Box Plot: CO2 emissions (metric tons per capita)

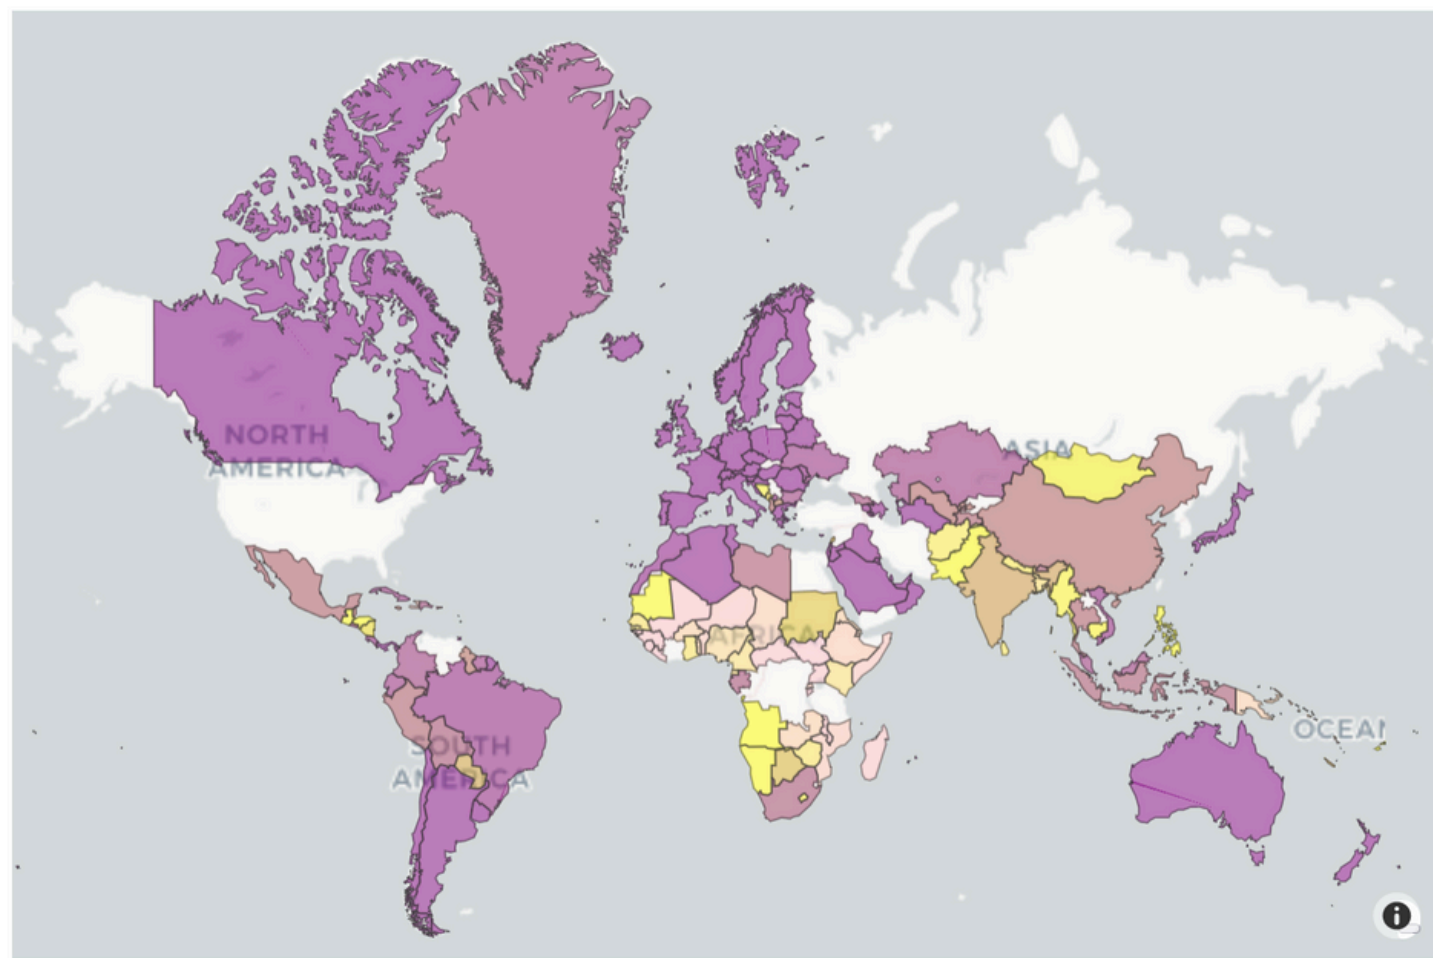

Box Plot: Total greenhouse gas emissions (kt of CO2 equivalent)

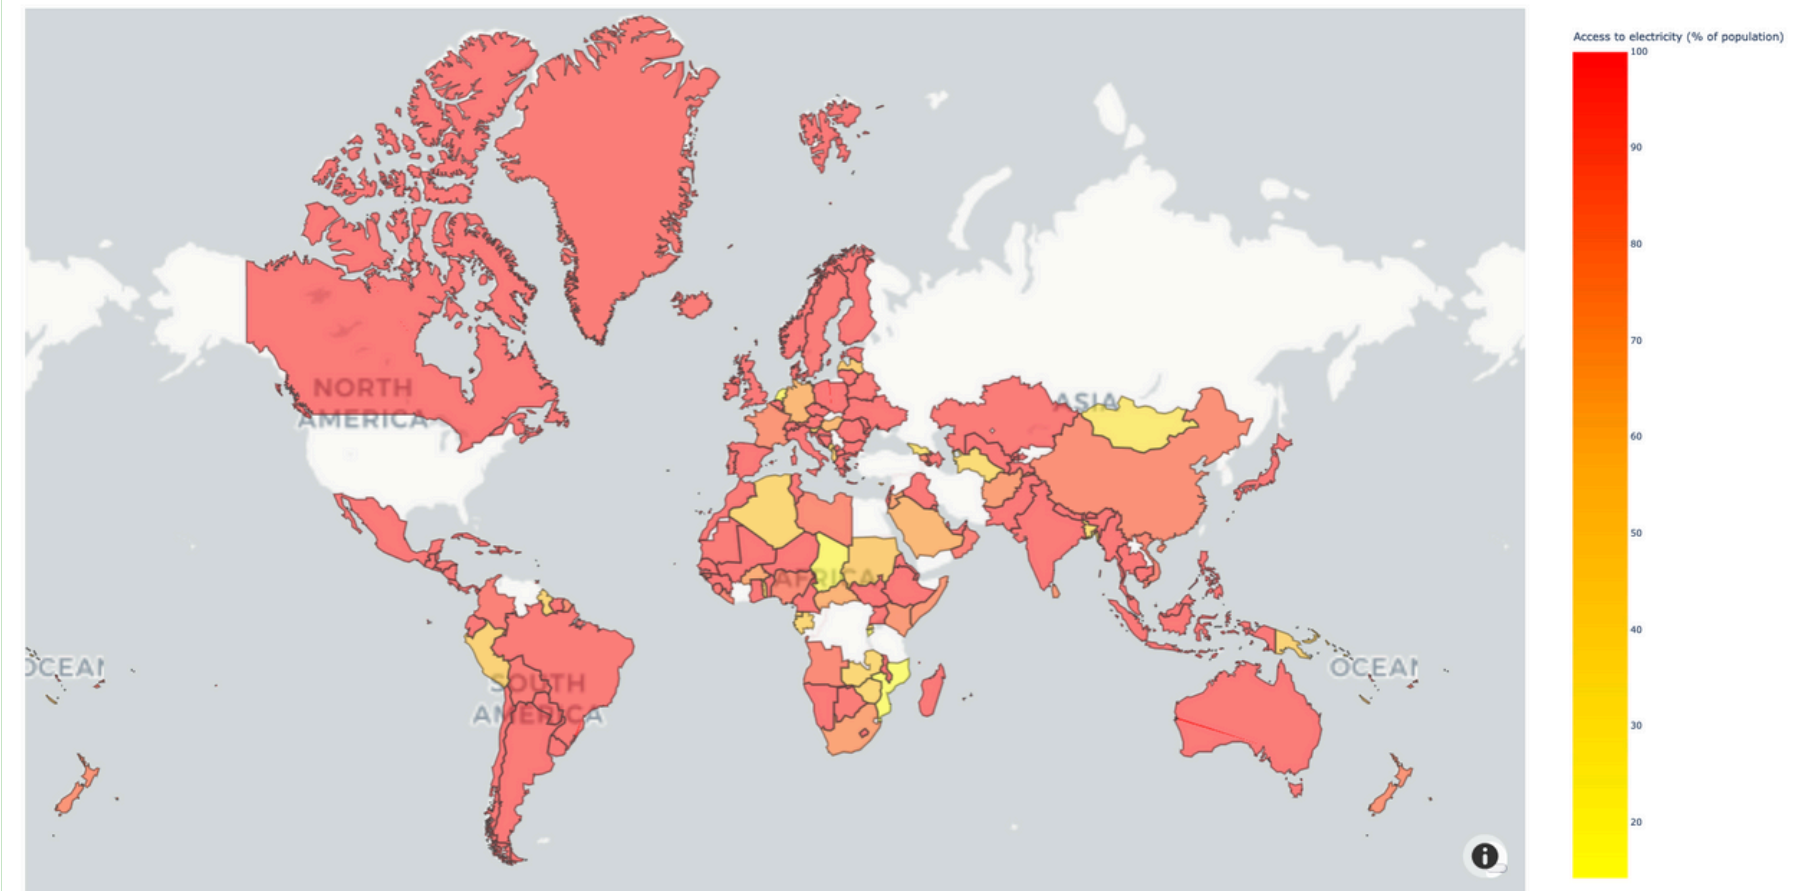

04

VISUALISATION

1. Is there an energy disparity between developed and developing countries?

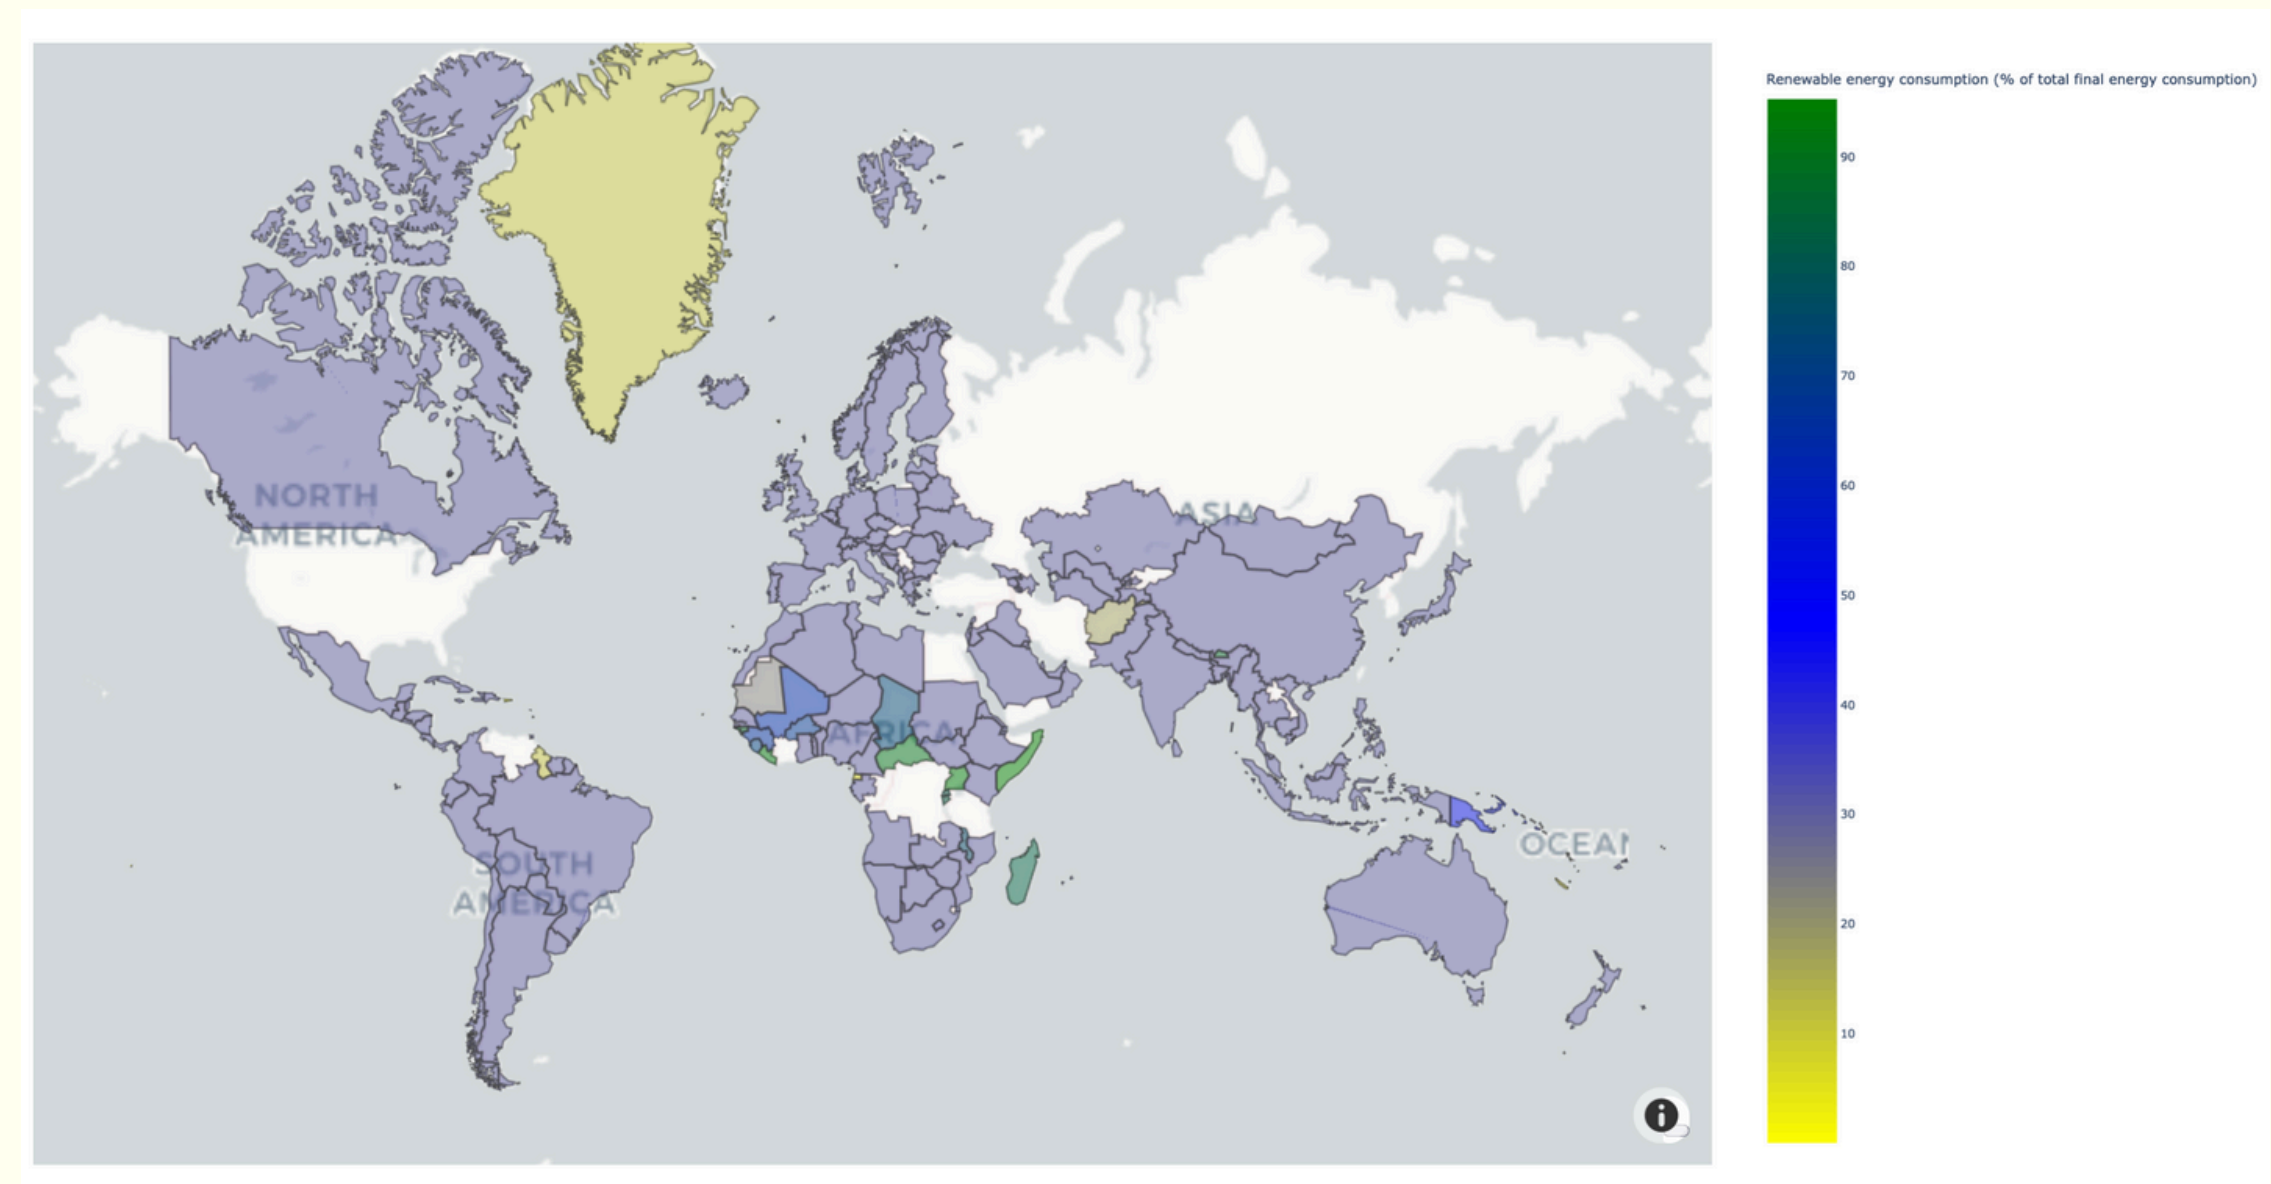

Access to clean fuels and technologies for cooking, in 2021

Access to electricity (% of population) in 2021

05

VISUALISATION

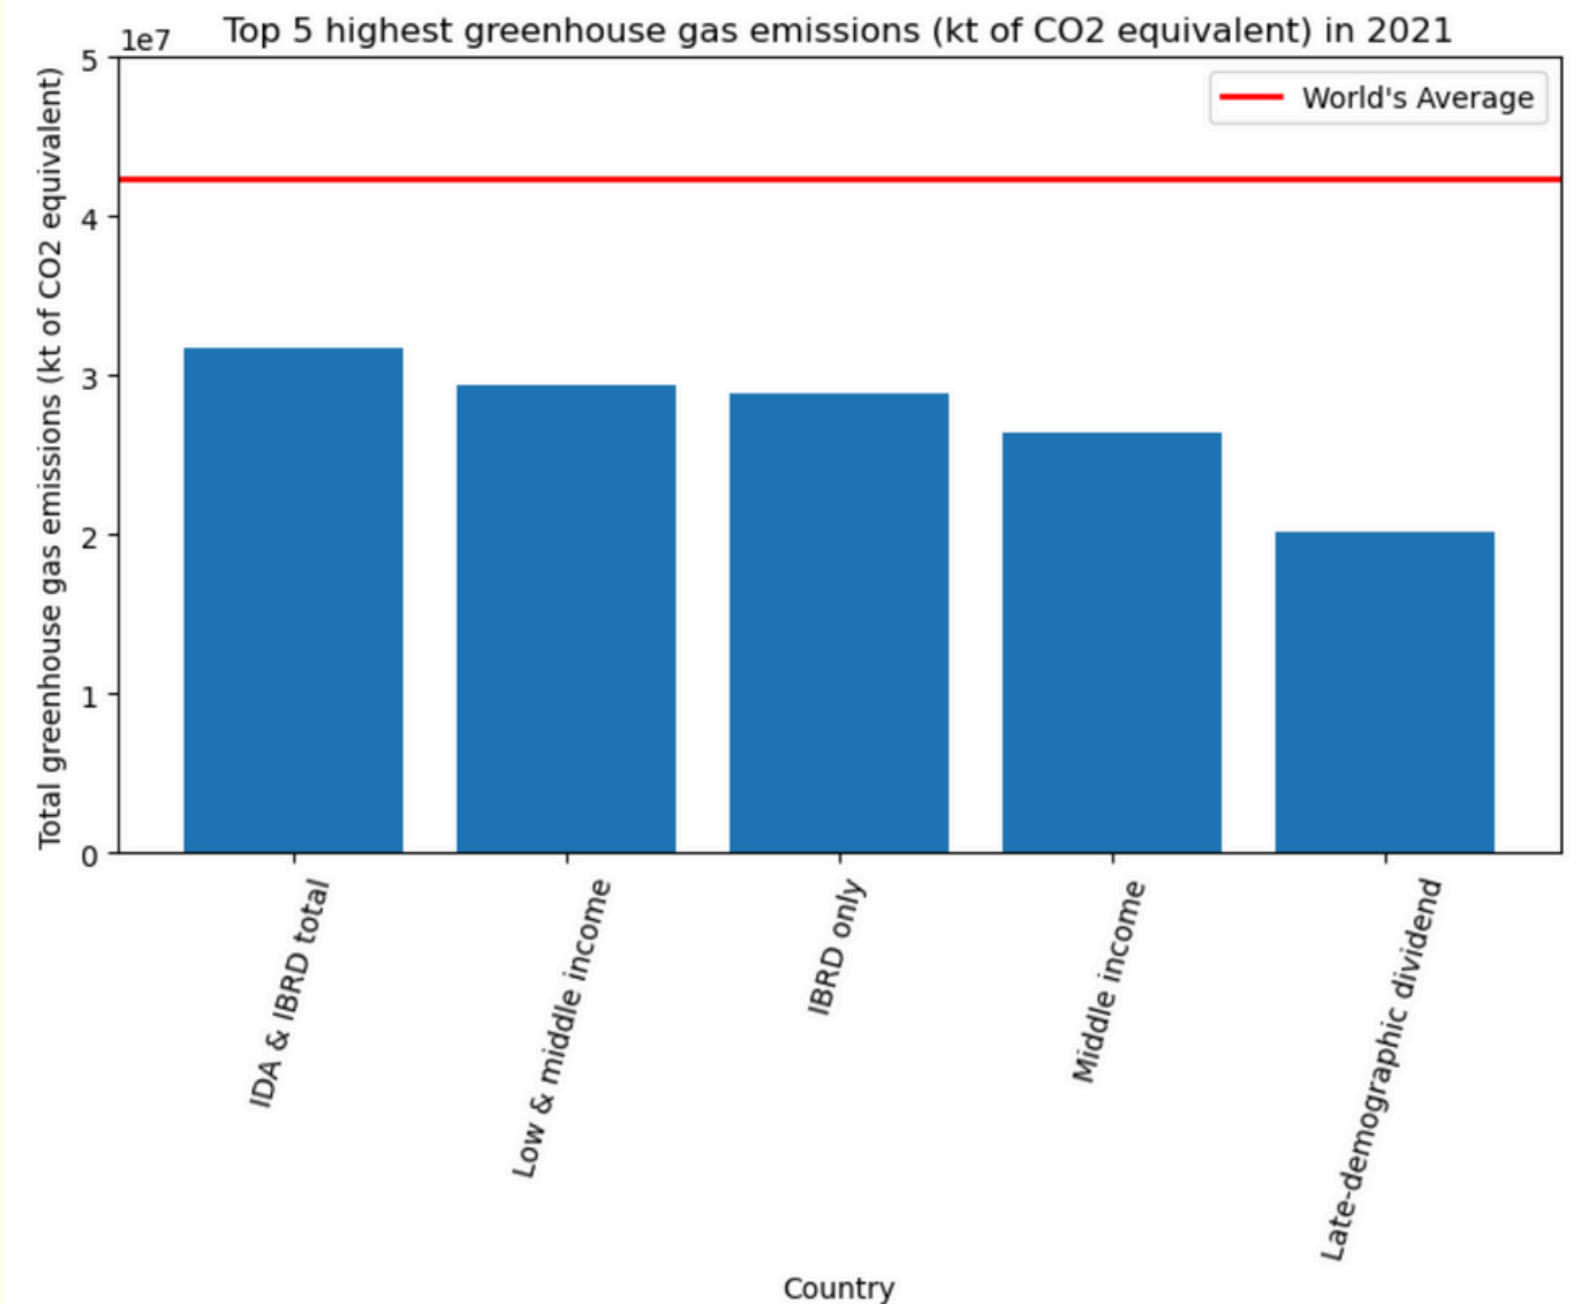

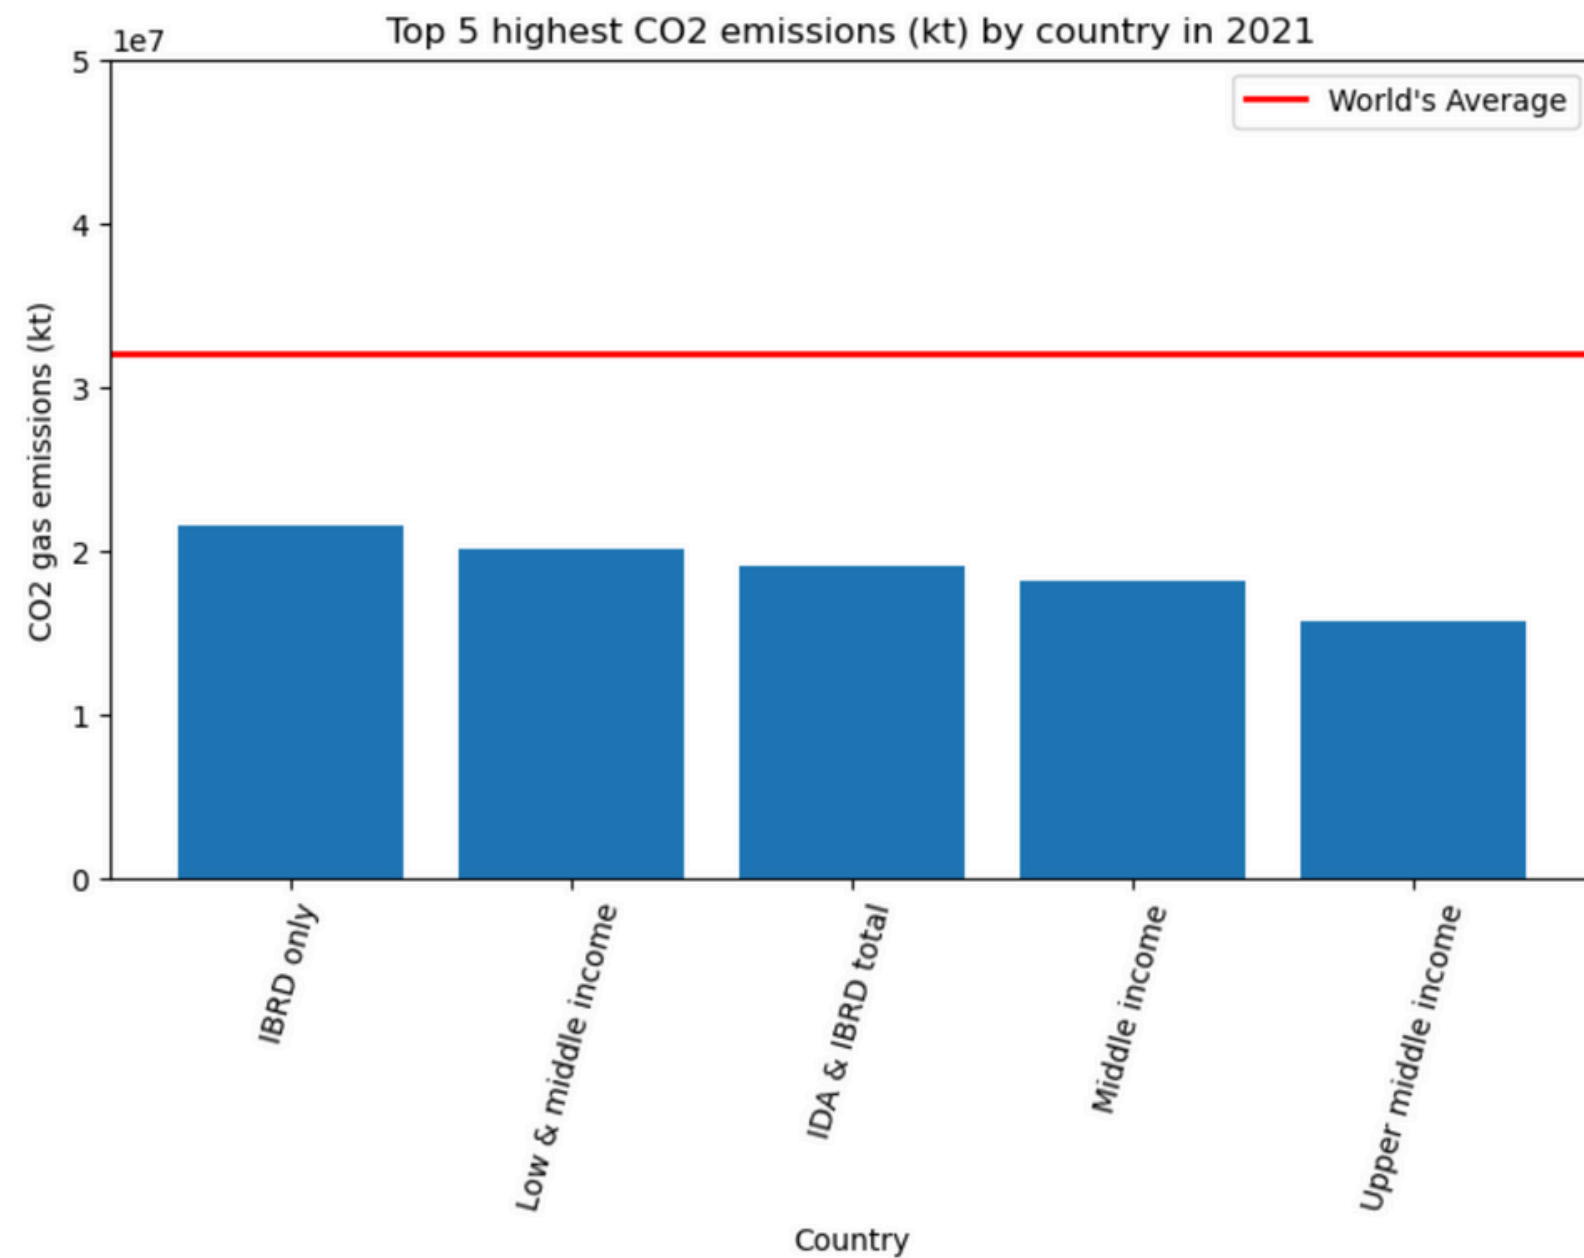

Renewable energy consumption, in 2021

VISUALISATION

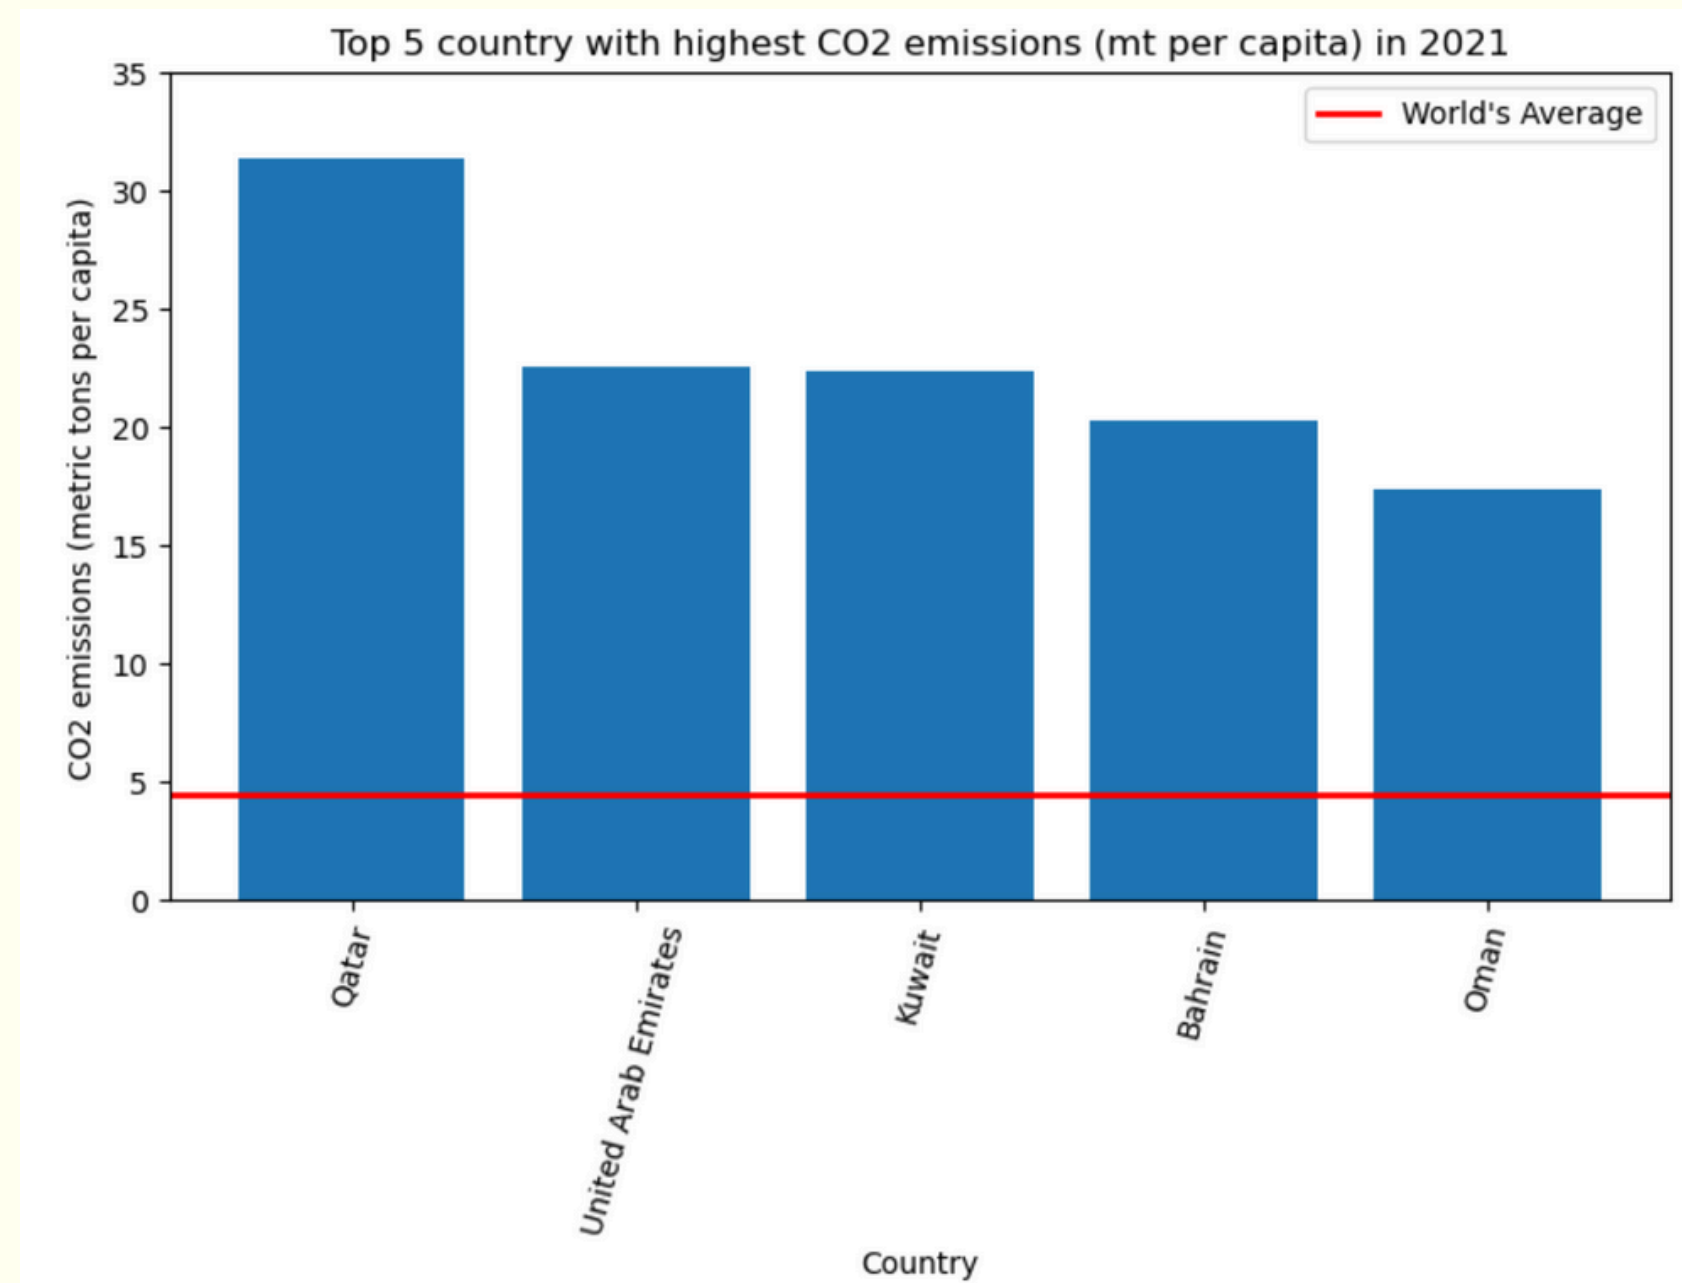

2. Which countries require urgent environmental policy interventions for carbon footprints?

07

VISUALISATION

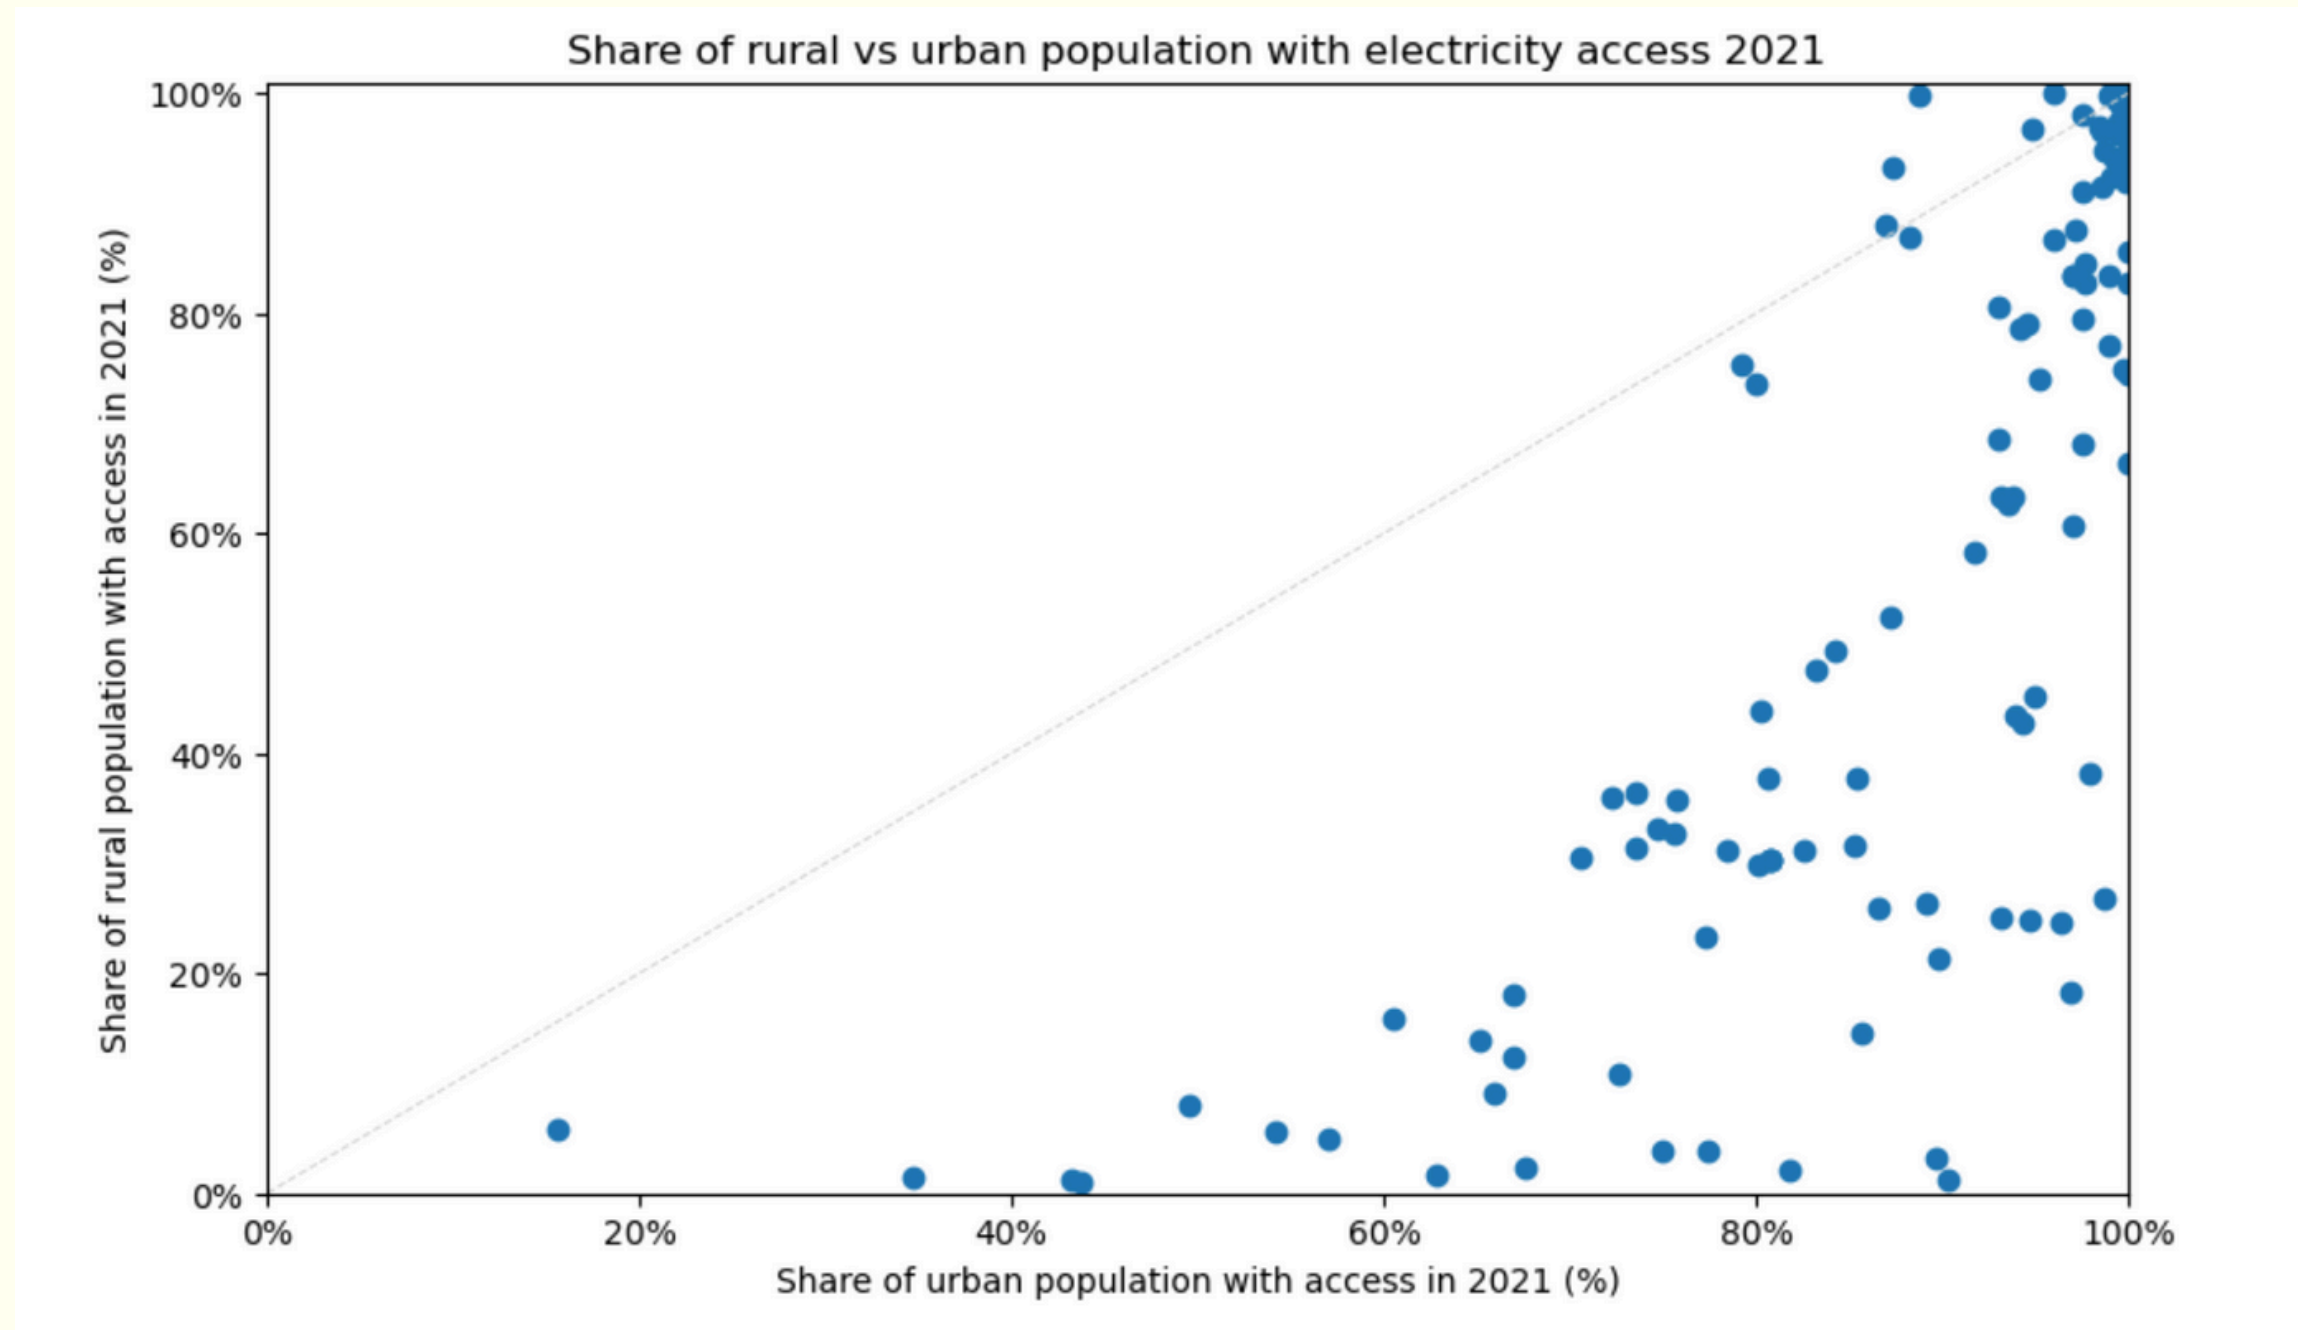

2. Which countries require urgent environmental policy interventions for carbon footprints?

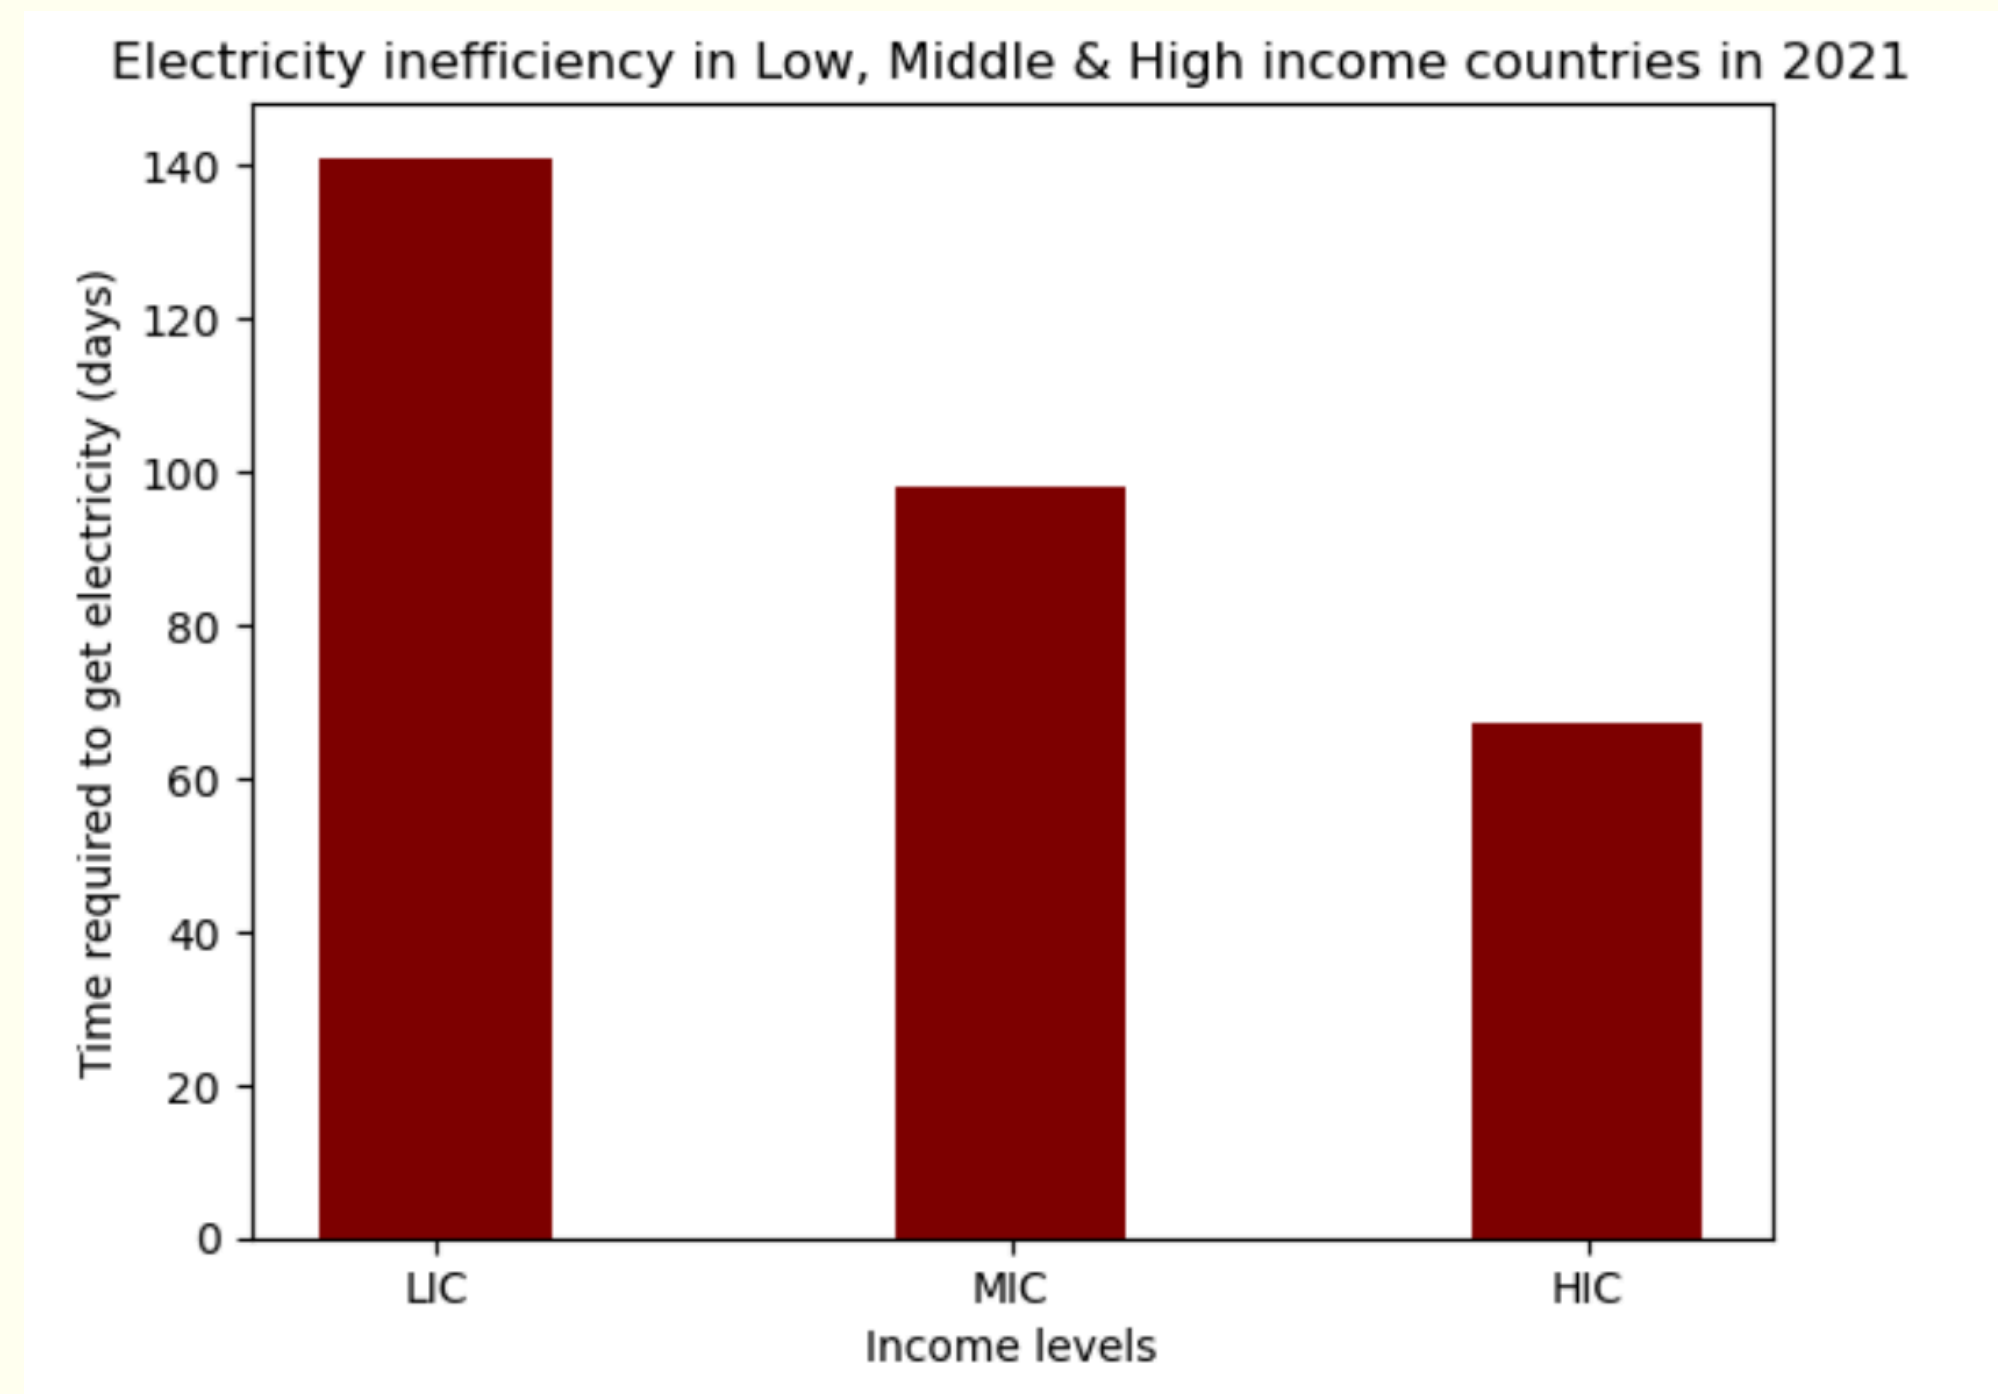

VISUALISATION

3. Is there a disparity between rural and urban population electricity access?

VISUALISATION

4. Is electricity efficiency and its infrastructure development related to the different levels of income of a country's population?

POLICY RECOMMENDATIONS

Focus on developing rural areas in countries with low population income

‘Address cost effective deep renovations which lead to a refurbishment that reduces both the delivered and the final energy consumption of a building by a significant percentage compared with the pre-renovation levels leading to a very high energy performance’ (EC, 2012).

Focus on Middle-east countries that have a huge oil sector activity

As world oil demand rises, the Middle East must find another way to produce energy.

- Diversify and find sustainable substitutes to current energy generation methods.**
- Monitor and fix target objectives**
- Penalize with fines if the short-terms targets/ plans are not met.**

LIMITATIONS

Data:

- Is the data accurate?

Need to cross-check it with another similar database.

- Variable dictionary doesn't mention which exact countries are included in 'Low income', 'Middle income' and 'High income'.

Which makes it hard to identify target lower income countries to apply our policies.

LIMITATIONS

Analysis:

- Do we need to remove outliers because they are representing false data?

Need to compare with another dataset to make a better conclusion on outliers.

- Does not consider all the variables that have an impact on emissions.
